

README: EXPO2008

To install EXPO2008 for Mac OS X, double-click **Expo2008 (1.6.6b).dmg** to mount the image on your Desktop and select the proper folder according to the version of Mac OS X running on your machine. The Mac OS X version can be checked by clicking on the Apple menu and choosing the About This Mac menu item.

Each of these folders contains:

- the "expo" package. The package can be installed by simply dragging the icon in the Applications folder (preferably);
- the file expo.zip, which is the compressed version of the expo package;

The mounted image also contains a couple of useful applications:

1. **X11-2.2.1.pkg** To run Expo2008 it is necessary to have X11 installed on system. X11 is installed by default in Mac OS X 10.5/Leopard but it IS NOT installed by default in 10.4/Tiger.

To check, look for the X11 icon in the Utilities folder, contained in the main Applications folder.

Otherwise, X11 can be installed using the included package (double-click the icon to run the package installer).

2. **GNU gfortran-4.2.3.dmg** EXPO does not need gfortran to be installed on the system where it runs, nevertheless it has been added to avoid problems that might arise with some system configurations. Gfortran can be installed by mounting the image and running the package installer.

For any problems or questions, please feel free to contact me at sabino.maggi@ic.cnr.it.
